CTA Study Group Sessions - Transcript

00:00:00

Kumud Thakur: Do you see my screen? Okay.

Javier Flores: Yes.

Kumud Thakur: Okay. Uh my name is Kumar Tago. Today I'm going to present a solution for United Bank. Uh United Bank is a is in a business over 75 over 75 years which is which is the and the United Bank basically selling a finance product like a bank account, insurance, uh credit cards and debit cards. They do have over 2,000 branch across the five geographical location. They do have a B2B and B2C business model and UB expect to grow in footprint in Asia in next 5 years and the challenge is they do not have a visibility into sales activity and customer interaction and they would like to improve their customer contact center manager as well. So uh currently USC branch uh branch track need analysis and application manually using a spreadsheet. So to uh to and using spreadsheet. So we will going to replace as a part of this project the spreadsheet systems with a salesforce and uh UB content center are looking to improve productivity and customer satisfaction to improve their service process.

00:01:09

Kumud Thakur: I would recommend to use Salesforce sales service portal with web chat and knowledge articles and FAQ. And we will also I will also recommend to use a Salesforce voice for the phone integrations. And now I moving to the uh the actor sheet here. So they do have a five types of employees. The branch staff employee I

recommend to use sales license here because they do need access on account management and the opportunity. Similarly, branch manager is going the staff is going to report the branch manager. So I recommend to you sales license and executive also I recommend to sales license because they need a access on the account and opportunity and then we have a contact center agent I'd recommend to you service license because they do need access on the omni channel service cloud Salesforce voice and they also uh for the contact center manager I'd recommend to use service uh license and the we do have a third party agent who help the uh United Bank in the sales I would recommend to use partner license because they need access on the opportunity and So here is the role hierarchy.

00:02:12

Kumud Thakur: So they do have a five geographical region. So we'll create a per per region roles. So we have a CEO then executive then we have a branch manager and the under branch manager we have a staff employee and under that we and under the branch manager we have a third party agents as well. Uh similarly for contact center manager will be uh the manager for the contact center agent app and we do have a customer uh customer user also for that I do recommend to use a customer community license. Moving uh to the uh United uh bank uh so this application need to be supported in a multi- language. So we will enable the custom label in Salesforce and with the translation workbench. So we can support these five language English, Japanese, Chinese, French and German. And we will use a custom uh label in the in the visual force template for the email uh translations. United bank system. Uh so let me go to the uh system landscape here. So now uh basically we I recommend to use Salesforce with the with the service cloud and the experience cloud for the customer facing and the partner facing and we recommend to use a Salesforce boys for the phone integration and we do have a requirement to validate the address.

00:03:25

Kumud Thakur: So I recommend to use a global address validation package here. This is apppection product. So they do have a data warehouse. So now going forward their data warehouse going to be integrated with sales for through musoft. So I would recommend to use a musoft here. Uh I am they already have a ESB. I am assuming they do have Muoft. So uh to integrate mu sort with the salesforce I recommend to use JWT uh v token method plus mtls to to make it very secure communication between the these two system. So when we configure the uh inte uh the JWT flow we have to create an action app in Salesforce and uh and and the muoft have the JW token to get an access token from the Salesforce. Similarly they do have a core banking system called system uh system a main frame system. So this system is already integrated with their existing CRM. Uh they do have a five geographical CRM. They're going to retire uh retire in future and replaced by the Salesforce before they go to retire.

00:04:22

Kumud Thakur: I'd recommend to you we will uh retire like one at a time and we will you migrate all the data to the Salesforce using ETL called Informatica. So Informatica again uh is linked with Salesforce uh authenticate Salesforce using JWT plus MTLS flow and the Informatica will use bulk API to load all the data. I also recommend to use marketing cloud because we have to have some social media uh process to get the lead into the salesforce. I I recommend to use marketing cloud here and for the customerf facing mobile app I recommend to use experience cloud publisher app and for the internal user I recommend to use Salesforce mobile app and to for the single sign on I recommend to use octa IDP as an IDP and we will use sle 2.0 uh sle 2.0 to log into the Salesforce and the flow will be IDP initiated flow and for LDAP the internal employees are uh use LDAP as an AD and for for the partner they do have a custom LDAP uh moving uh to the so now the current challenges they uh the current challenge that they need to address a part of this project so they want to prevent the duplication of customer and contact so before we load the data into the Salesforce historical load we will clean the data inside the Informatica ETL we will write all the duplicate rules

here and clean that data and we'll load the clean data inside the Salesforce and going forward we will set up a duplicate rules in Salesforce to avoid any duplicate customer

00:05:46

Kumud Thakur: data in Salesforce. So right now there's a no address validation check. So I'd recommend to use global address validation for the check. uh UV brand stopped no to more efficient track prospect and potential. potential deal for that we will use the sales cloud uh lead and opportunity object. Uh the branch staff currently have to login using system specific usernames we will replace this login process with octidp will enable the single sign on in salesforce and with the sle flow will do the user will login into the salesforce through single through IDP initiated flow. US branch staff cannot create relationship between customer. So to accom accommodate this requirement we will enable the uh account contact relationship with the help of that account contact relationship uh one person can relate with many uh creating a new bank account is a 15step process in the current uh in the current system. So we are going to replace this bank account process with the lead and opportunity. Uh right now there's a no mobile option. So we'll have a mobile app for internal user and a publisher mobile publisher for customer.

00:06:53

Kumud Thakur: uh you would like to tell the CRM system and implement the following changes. So uh before uh they load the data uh into the salesforce uh we will use clean the data in the ATL and uh create a single customer master for all the customer records. So Salesforce is going to be master for all the customer in future UV branch staff can create prospect and sales opportunity. So I recommend to use uh we will use lead and opportunity of Salesforce. Uh provide real-time address validation. Again we'll use a global address validation app product. Provide web chat functionality. We will use Salesforce enhance chat feature. Provide FAQ in the contact center. Recommend to

use knowledge articles with FAQ. Provide an option to use mobile across the branch network. We will use Sal mobile app use using single sign on. Provide a recommendation for either a single or multisale for instance. I recommend to use single or sales cycle. Uh US branch staff schedule financial planning workshop through social media channel.

00:07:50

Kumud Thakur: I recommend to use marketing clouds here to capture all the lead from the uh uh from the social media and then clean the lead and create the uh clean lead in the inside the sales force at the work so US branch staff get the attendee information and create a prospect. So to uh to combat this requirement recommend to use a campaign we have a campaign against the campaign and the staff will create a lead and we have a set duplicate rule set up inside the sales force. So it won't it won't allow to create a duplicate uh lead inside the system and before the address validation we will use a global address uh package uh staff call interested customer after the work. So after the swap uh campaign lead campaign uh uh we have a campaign under the campaign we have a lead uh and we are campaign member. So with the help of campaign or lead uh uh we have a we will use a scheduler uh to uh schedule an appointment with the customer. uh US branch start then create a need analysis that that ask the customer a series of question to uh ask a series question from the customer over phone or or onetoone meeting.

00:09:01

Kumud Thakur: I recommend to have one custom object called QA. We will QA c QA object having all the questions in that custom object and then we have a QA response where we are going to capture the customer response and QA response will be a child object for the lead and uh for the user uh for the user standpoint the we will have a screen flow where we'll populate all the questions there and uh and and the the staff

will populate the corresponding answer for each question for the each questions the the need should trigger the application to make financial product suggestion. After the analysis, we will have a one more screen flow which basically display the suggested product. So we I I recommend to use a product object where we have manage all the bank product and we will have some rules uh configuring the custom metadata and with the help of analysis response and the custom metadata we will populate the recommendation product and uh in the screen flow. The final step is the customer need to choose a one recommended product.

00:10:03

Kumud Thakur: As soon as the customer choose the recommended project product, we will convert the lead into an opportunity with account and contact. If the customer is already exist, then we will merge that lead with existing account and contact. Then uh once we have opportunities created, we have opportunity product where we have that selected product uh as opportunity product. Uh once this process is done, they want to send the uh that they want to send the analysis to the customer. So I'd recommend to use do sign template here where we generate the PDF uh and send to the customer sales opportunity could create should not have expected close date to week for the current date. So to populate the closed date I would recommend to use a before save flow with a close date plus two weeks. Use USC third party agent to gather prospect to uh uh sorry uh uses third party agents to gather prospect. uh I'd recommend to use a third party a partner license for the third party agent. So they can the third party agent can login into the experience cloud or partner community where they can create a lead and talk to the customer.

00:11:08

Kumud Thakur: Uh bank account application process the deals are uh that are transaction type. If the lead is converted to an opportunity and the transaction type is

financial product then the opportunity then the staff will make that opportunity is closed bone and we will create a asset and we we will use asset SNM uh bank account uh the you the United Bank staff member third party and convert the prospect to a customer record. So the the third party didn't have a partner license they allow to convert a lead into an opportunity or a customer and when they convert the opportunity into the account and contact and the opportunity under the account they have to upload the document like password and identification document like password and proof of address for that I recommend to use one custom object where we have a document checklist and under that we have a standard Salesforce file object content document content document link and the partner community user having the custom screen the screen flow where they have a uh steps to upload the files against each type of document if the third party agent convert the prospect uh the converter should be assigned to the U branch.

00:12:15

Kumud Thakur: So once the uh lead is converted once the lead is converted opportunity by the partner it is going to be assigned to the branch branch manager of assigned to the regional manager of that branch. So third party generally report to branch manager. So we dynamically populate the regional manager on the opportunity as a owner doing the lead conversion. The US branch staff create a bank account application capturing which customer need access to the account and the bank account product. So the application should be in progress. The if any of the application under uh 18 then should not be able to submit it. So a maximum five link are allowed per account. So to accommodate this requirement I would recommend to use opportunity contact role. So in the opportunity contract role we can uh allow to add up to five applicants as and we will write an AEX trigger to avoid more than five applicant and also check the the age of each applicant. At any stage UB staff member can contact the application using a predefined email which could include request uh for information denial or application.

00:13:18

Kumud Thakur: So if any of this thing happen then we will just mark the opportunity as a closed lo. If the bank account application is a foreigner investor uh so if the bank is foreigner then we need to uh we need to we need an approval before we go ahead with the opportunity or application. So uh at this point of time we will configure the approval process opportunity and check the uh person account or the account country. If it is it is not in the current country then we'll uh file an approval process and we'll go to the branch manager. The bank account application must be subjected to review by government agency. So to review by government agency I recommend to have an integration here. So on the opportunity we will submit the application uh from the opportunity. Then we have a record trigger flow which basically publish an event and then uh the musoft will listen that event and do the remote calling inside the salesforce get all the details and send the data to the agency. Once the agency respond back to the salesforce it will update the salesforce back as a cancel status and send email to the staff when the application details are complete the complete the UB branch staff submit the account.

00:14:26

Kumud Thakur: So uh always should be sent to core banking system. So now once the application is completed and then uh the opportunity is submitted to the uh to the core banking system. So again we are recommend to use same uh request and reply ination pattern here because we need a response in real time. So the opportunity uh opportunity submitted the record type figure get triggered and it called the ESB uh and then the mulesoft will do the remote call inside the sales force get the all the related details like opportunity and opportunity product or the account and it will send the data uh to the Go. system and once the core system is processed the data successfully then it will create a asset as a bank account in Salesforce with all the uh related detail like account number and then it update the opportunity status to completed this is closed and here we use request and reply method because we need a response in real time and if there's any error then muoft will uh help us to orchestrate

that error and display on the Salesforce screen if the core value system written in errors and it should be displayed on the page.

00:15:29

Kumud Thakur: So we have a request uh screen flow. So we can see that error on the screen flow itself. Any application not submitted for 7 days should not so we'll have a schedule flow which run daily and check if the application there's no activity in last 7 days then we'll send the email to staff member. Customer service processing uh you contact natively to service customer by phone email and web chat. So I recommend to you Salesforce boy with Amazon connect and then email to case and live chat. We use the Salesforce announce chat feature uh UB context and DW to search for customer. So uh using the UB customer number, 4D social security number and bank account number. To search the customer uh we will make these three fields uh external ID and then it will be glo then they can do the global search and the account is uh account is account is private but they we will have a criteria sharing to share that account with the customer center agents does not exist. they need able to create a customer and send this information to core banking system.

00:16:28

Kumud Thakur: So that will return a unique customer number. We will create a uh create a permission the account contact readr and submit to a uh uh core system and then we will submit using the integration pattern fire and forget where will do the remote call inside the salesforce after the listening the platform event and create a record in core system. Customer can raise service request on their mobile device. So uh the customer can go to the go to their mobile publisher app and then a facility to create a case from the mobile app. So they do have an access on the case and once the case is is created it route to the salesforce using case assignment rule uh or uh with the help of regional queue it assigned to the regional queue and then we have a

omni channel which assign the queue uh case to the right representative which are available contact center agent create service record for inbound contact with customers. So and they would like to they do have a service level agreement and a time dependent SLS to accommodate this requirement recommend to use SLA and we will implement the entitlement process and milestone with milestone actions.

00:17:36

Kumud Thakur: If there's an any action is missing then we will configure this uh these two actions in the milestone action uh in the milestone actions. Uh contact center agent need the ability to amend a customer address. Uh so uh the customer uh the customer uh sorry the contact center agent have the ability to edit the customer address. They do have a access uh on the on the fields to change the address with the help of that global address uh app app action product. They can search the new address and updated it and if the contact is inactive then they are not they are not allowed to make any change. So we will write a validation on the person account or uh account and contact to avoid the such to avoid such uh to to allow them to uh update address in the inactive uh contact uh updated address need to send to core system. So once the address is updated by the agent then uh we have a record trigger flow on that object on the contact object and it will publish an event and we'll listen that event and pull do the remote calling get that all the data and send to the uh core system the integer pattern will be event driven fire and forget here uh contact center agent need to search for bank account transaction so transaction is very high in the volume so I'd recommend you an external object here where we have uh and with the help

00:18:56

Kumud Thakur: of O data uh connector. It could pull the data from the uh from the core system and uh they can do the search uh inside the Salesforce and it is related to the uh uh account and the asset and we will use a LWC component with this filter

because they do have a specific filter like by date range account number and we'll create a one custom component to uh to to to put these filters on that transactional object. uh UB content center create employee discipline we will create a custom object for email display. Uh customer have a requirement to access a portal to raise a manage their service request. So to manage a service required they or the customer have access in the customer community where they can see their cases and they can manage their profile data or they can also see the FAQ there. So on to access their own cases we will write a sharing set with the help of sharing set they can have access on their case data requirement. uh you would like to update all customers with the core banking.

00:19:52

Kumud Thakur: So for this I let me go to the lost.

Avijit Chakraborty: You can do zoom to content. Click on the 33% and then do a zoom to content.

Kumud Thakur: Oh yeah,

Avijit Chakraborty: It will do

Kumud Thakur: sorry. Yeah. So, uh now for the data migration. One sec. Okay. For the data requirement, uh they do have an account in the core banking system. So, I'd recommend to use ETL here. So we will push all the account customer data from the core bank to Salesforce and initially we load the data in the partial and it in the salesforce and we will all all the dup and data cleansing inside the ETL and they do have also have a spreadsheet so we'll move all the lead and opportunity to Salesforce through ETL again and they do a CRM like there are five CRM so all the data will be go to the ETL and the CRM with I am assuming they do have a data around leads and opportunity as well and I recommend to use recommend to load only last year of data inside the Salesforce because of the high volume and the rest of the data will move to the data warehouse.

00:21:17

Kumud Thakur: So all the the master data remain we need to push into the Salesforce like customer data. So it will remain to push but the transaction data we can move to the data warehouse which is older than three year. So for when we do the data migration I recommend to use the a specific order where we upload the user first and product and account contact case opportunity and we have to load the data in a do different uh like we have to plan make a cut over plan to load the data into the salesforce and there also requirement where bank account and their relationship that are created directly in the core system should be update in Salesforce on the nightly basis. So there is some relationship update in the core banking system to to accommodate this requirement. I recommend to use a batch data synchronization. We will write a job in the ETL which sync the data from the core banking system to the sales for on nightly basis. Existing sales opportunity or prospect uh should be made available in Salesforce.

00:22:14

Kumud Thakur: Each branch had two sheet pro uh two spreadsheet. So for that we I already already mentioned like we will use uh we will use ETL to load the data from a spreadsheet to the salesforce and we will all that do the cleanup and pick Ply standardize before we load the data inside the salesforce sales opportunity process should be within the data warehouse. So we will uh so we will move uh the data into the data warehouse also we will uh sync all the data whatever we have in Salesforce to the data warehouse like the future leads and opportunities the system should ensure minimal duplication customers for that we will load the claim customer data using ETL and after that we will write a duplicate rules approximately 10k need analysis are created daily with a 25% progress so for that I'm moving to the LTV calculation so for analysis we keeping the analysis in the QA. So the the calculation is we are creating 10K analysis per day. So it is going to be 365 uh uh 365 uh 3 million 3.65 million then we have a 7.3 million and then it going to be 10 million in third in 3 year.

00:23:24

Kumud Thakur: So it is LDV object for sure. Uh uh you would like to uh you would like to load 5 million historical service requests. So these cases will will load into into the case object of Salesforce. I would recommend to use only 2 million of cases inside the Salesforce because then because they also have an growth of 5K per day. So to avoid LD situation, I recommend to use only 2 million data in Salesforce and rest of the data will do the data virtualization using O data inside the Salesforce. Uh-huh. uh reporting uh requirements uh US branch staff and third parties then can view a report on need analysis. So we will create a report uh on the need on the QA QA QA response object to see that trend. Uh US branch executive would like to dashboard track that their team performing branch. So we will create a report on the opportunity which are closed bone bone and we will group by the account owner and the executive will able to see their uh subordinates sales manager sales staff data.

00:24:25

Kumud Thakur: Customer need to able to to view history of their service request. So I recommend to create a report uh or uh sorry the customer need to customer doesn't have access to the report and dashboard. So I'd recommend to you just they will use a list view. US branch manager need to able to perform a trend analysis how long a spend. So I'd recommend to create a report on the uh opportunity history to see the track accessible requ uh requirements uh in user need a store active directory. So I recommend to use single sign on using octa IDP inter need to document provisioning and deprovisioning I recommend to use octa scheme here customer can self-register for access to application uh we will enable the self-registration on the portal security requirement uh UB branch manager U should only see customer related information in their geographical location so the the role hierarchy will help us to control that visibility

uh USB branch and execut uh so the agent The executive is a top in the hierarchy of agents. So they will they can easily see that agent information through role hierarchy.

00:25:30

Kumud Thakur: Uh certain branch staff manager trained to so can create application. So they will uh we will create a there's some high-risk products. So we will uh create a price book. Uh and this price book share with a specific public group. Third party only have access to a needless record that belong to them. So the the third party have a line man uh have a line manager. So we will have a partner role hierarchy. So they can see the data in the role there on in the same hierarchy. US branch manager can view the need analysis record for the third party. So here again the partner role hierarchy help to for this visibility. Contact center agent can view all customer. We will the account is account OWT is private and then we have a criteria sharing loop to share all the account in the public read mode. Contact center agent can see all case related in a geography. Again we will write a characteration rule using a using a region.

00:26:24

Kumud Thakur: The agent cannot delete customer record. They do not have a delete permission on their persona. Employed service must not visible to contact center. The the OWT for this object is private. We'll use a criterioning rule to share the data with the manager. Social security number is considered confidential. We'll create an encrypted field for the social security number and it will be visible to only the branch staff. We have a we will create a permission set with the view encrypted fields need the ability to view FNQ. Uh so we'll we'll write a sharing set to share the FAQ uh and the service requires. should not have the ability to see service request. Uh customer should not have ability to see the service request raised by their customer. So sharing setup doesn't allow to see other cases. Uh executive should see rollup summary they can

create a report and with the help of uh role hierarchy they can able to see the subordinate data. All web service need to be secured.

00:27:20

Kumud Thakur: So we'll enable the MTLS. And now moving to the LD calculation again. So now right now they do a 30 million account and contact. They're going to be increased like they're going to double in upcoming five years. So I just I'm trying to I'm here calculating only three years data. So in theory four uh the 44 million is going to be LDB and contact is also LDB similarly and I'm assuming the Q the need analysis or Q response is the same number of leads. So I using the same like 3.6 6 million in the first year that's 7.3 million and 10 million in 3 years. Similarly for opportunity we have like 0.73 million then 1 million then 2 million. So opportunity may not be opportunity is not a LDV object here because migrator is whatever is greater than 5 million is LDV. So so here in the data so here I just marking the LDV objects and then we will use a external object. Similarly for case case LD object for the case I'm proposing to use external object where we can see the data virtualization and I recommend to use enable I recommend using single with a multiurrency and multi- language enabled.

00:28:43

Kumud Thakur: Yeah, thank you. That's all.

Avijit Chakraborty: Good, great job, Kumud. So,

Kumud Thakur: Thank you.

Avijit Chakraborty: are you ready for question answer or going to take a little break?

Kumud Thakur: Yeah. And let's start.

Avijit Chakraborty: Okay, so I have one question on reporting from the bottom.

Kumud Thakur: Mhm.

Avijit Chakraborty: So if you go to the reporting uh the

Kumud Thakur: Mhm.

Avijit Chakraborty: second bullet point and the first bullet point

Kumud Thakur: Mhm. Mhm.

Avijit Chakraborty: so you say like staff member and party agents can view report of need analysis and the application.

Kumud Thakur: Mhm.

Avijit Chakraborty: So can you please walk me through like uh how you are going to do that?

Kumud Thakur: So on the need analysis uh uh I have an object called uh QA response where I have all the uh uh this object where we have all the need analysis.

Avijit Chakraborty: Mhm.

Kumud Thakur: So then we will create a report on the need analysis like with the help of a lead lead with and the third party doesn't have a partner license so he can able to see the reports and uh

00:29:50

Avijit Chakraborty: Can you foresee any issue um like accessing the reports for the user?

Kumud Thakur: Um I don't think so because they do have a partner license so they can access on the report. So but they uh the the the staff we basically we have to share that report with them.

Avijit Chakraborty: Okay, move forward. I think Ronan and Jere if you have any question you can ask.

Javier Flores: I have a couple of questions.

Kumud Thakur: Mhm.

Javier Flores: Um you mentioned on your landscape that uh you will be using for I think for octa uh IDP initiated flow

Kumud Thakur: Mhm.

Javier Flores: right why or how that will work and why not

Kumud Thakur: Yeah.

Javier Flores: to use service provider initiated flow what's the benefits for Mortal K.

Kumud Thakur: So here I'm assuming like uh we have an octa where we have an homepage where we have all the multiple application like uh like for example core uh their core systems and data warehouse or maybe some other application on the page. So they can just click on one of them and it will generate a SL uh request for the service provider and then it will navigate to the service provider.

00:31:08

Kumud Thakur: In our case, it would be a Salesforce. Also, uh the service provider flow will also work with this. It is not something like a service provider flow is not going to work. For an example, if you have a uh Salesforce URL and then in the bottom you can see an option to login with the SSO or something like that. Then whenever you click on it, it will take back to the octa IDP the octa page where you have to authenticate yourself and then you will navigate back to the uh Salesforce uh the page depend on uh from which you have started

Javier Flores: Okay. And another question, you are suggesting marketing cloud, right? And you I remember you are using campaigns,

Kumud Thakur: Yes.

Javier Flores: campaign members, leads.

Kumud Thakur: Yes. Yes.

Javier Flores: How the marketing cloud will be interacting with the Salesforce or and what information are you sending and creating in in the Salesforce site?

Kumud Thakur: So for marketing cloud I'm using only for a social media channels. So I I just want to like push the clean data inside the Salesforce because sometime if you directly integrate Salesforce with a social media with with some other platform it is it could be possible like we receive sort of a spam leads inside the salesforce.

00:32:20

Kumud Thakur: So that's why I recommend is marketing cloud where we just clean the leads and then we will push only the qualified customer inside the salesforce and campaign and campaign memory I'm using for the for the workshops where the brand start do the workshop they can create a campaign for specific workshop and after that the maybe the customer do some registration so they can fill the information in the lead and associate with the campaign member.

Javier Flores: Okay. One question on that. What What do you mean with clean leads like clean leads?

Kumud Thakur: So I mean to say like uh if we do not have marketing cloud right so maybe we do not receive the quality lead inside the sales force like uh like sometime we customer fill the form from Facebook, LinkedIn or some other social platform. So maybe we receive a duplicate leads or maybe the leads are spam. They are not real lead.

Javier Flores: Okay. Um, for example, if I if someone register my lead on the Salesforce and I also click on a social

Kumud Thakur: Mhm.

00:33:20

Javier Flores: media ad or something,

Kumud Thakur: Mhm.

Javier Flores: how can we make sure that we are not creating duplicates?

Kumud Thakur: for that uh I think uh uh we have a duplicate rule inside the Salesforce to avoid to avoid the duplication of lead.

Javier Flores: Okay. Uh Ronan, do you have any question or did you want to continue?

Rónán Dillon: Yeah. Um, so for your the social security number being searchable,

Kumud Thakur: Yeah, it it will be. So although it is an encrypted field, it is not searchable. So we will create a one custom field. Uh behind the scene in the custom field, we will just keep only four digit. So the the user or the staff can search with those four-digit number and we will make that field a national ID.

Rónán Dillon: perfect. Yeah, I must have missed that. No worries. And then there was one you used an apex trigger.

Kumud Thakur: Mhm.

Rónán Dillon: Um I can't remember which requirement was I didn't write it down.

Kumud Thakur: So yeah there was a validation where they the they the basically it is not allowed to create more than five applicants.

00:34:28

Rónán Dillon: Yeah. So yeah. Yeah. How why did you choose Apex for this one?

Kumud Thakur: uh because there's a two requirement one of them like uh the applicant should be should not be less than 18 year old and the other because we have to roll up although probably it can be possible by the flow we can just roll up the count on the opportunity and then just then write a validation on the opportunity but I I recommend to use the AEX here because of the data volume and the AEX is more scalable as compared to the or robust I would say in as compared to the flow.

Rónán Dillon: trip. Yeah,

Avijit Chakraborty: Okay.

Rónán Dillon: it's a little man.

Avijit Chakraborty: Uh so Kumud my second question is uh when a person like is applying or coming as a lead and uh they have like more than one applicant to the lead how you are handling that

Kumud Thakur: So uh we have an opportunity contact role for the same. So let's say the new customer come as we he will fill the uh with maybe branch staff fills the application on beh on on his behalf over the call or in onetoone meeting then once he interested in a specific product like bank account or some other financial product.

00:35:53

Kumud Thakur: So he the staff will convert the lead in opportunity and after that he be uh the applicant would like to add a add some more user on the same account. So we will create an opportunity contact role. So he the first as a first step uh the staff need to onboard the applicant as accountant contact or I would say the person account in Salesforce and then those person account need to be relate in the opportunity contact role as a secondary user of that account or application.

Avijit Chakraborty: Okay. So, uh and then uh my next question is on I think um the interaction. So, where the interactions are being stored?

Kumud Thakur: uh interaction is going to be stored in the QA response and lead and probably be we I I recommend to use Salesforce voice. So maybe if there's a call interaction we will have that standard object for from the Salesforce boys to capture those interaction as an activities or we will use Salesforce activities object to for other interaction also like email conversation

Avijit Chakraborty: Okay.

Javier Flores: I have another question.

00:37:20

Javier Flores: I see in your data model you are marking QI response as LDB and also accounts.

Kumud Thakur: Yes. Mhm.

Javier Flores: So if you assign LDB to the QA response, why not to the QA object? Assuming that at least you have

Kumud Thakur: QA is uh as a master object where I am keeping the some set of set of questions.

Javier Flores: Yeah.

Kumud Thakur: I think the naming term is a little confusion like it's just just questions.

Javier Flores: But for example,

Kumud Thakur: It's not like answer is a mastered object where I have like setup question maybe 100,000 right and I we are asking the keep same question with the customer.

Javier Flores: yeah. So we can assume that like a question may have at least one Q response, right?

Kumud Thakur: Mhm.

Javier Flores: So a Q response it's LDB. Why not question will be an LDB assuming that one to one

Kumud Thakur: So uh okay it shouldn't be right the the reason being uh let's say we have 100 questions that we ask from the customer. So this is my master list.

00:38:30

Kumud Thakur: It is going to be always 100. Probably it will increase by 10%. Next year we add some more questions. So I'll add new questions here. And then whenever interact I interact with the customer I will ask the same same set of questions and putting the response in this object.

Javier Flores: Okay. So that means that you are reusing the same question for different leads, right?

Kumud Thakur: Yeah, the same question, same set of questions.

Javier Flores: In that case that will fall in a skew issue.

Kumud Thakur: Yeah, it could be a good question. It could be because then uh yeah, you're right. It's going to be skew because it could be possible like one question can have a many response. Okay. to avoid such situation. Uh then probably we should not relate this lookup and uh we just link uh because I have a screen flow. Then with the help of screen flow I just on the runtime I populate the question on the screen and the and the staff or the staff will populate the answer corresponding answer.

00:39:51

Javier Flores: Okay.

Kumud Thakur: I will not I will not link this then look up this Q problem.

Javier Flores: Okay. I have another question. You mentioned you are using knowledge base right and also you are enabling multil-

Kumud Thakur: Yeah,

Javier Flores: language. How are you planning to handle different knowledge articles in different languages?

Kumud Thakur: I think we have to create uh if I'm not wrong, basically we have to create a articles for each language. That is my understanding. We have to create a different uh knowledge article. Like if we have a Japanese language, we have to create a Japanese uh articles and when the user uh login the customer log in and you're looking for that u that the FAQ or knowledge, right? So it will dynamically read the customer language and then the corresponding uh during the search it will return the corresponding uh knowledge article

Javier Flores: Okay. And one last question. I remember you mentioned you will be using an encrypted field for I think

Kumud Thakur: social security assists for

00:41:01

Javier Flores: it's Yes. And that one should be searchable right in the global search.

Kumud Thakur: Yeah.

Javier Flores: If you are using encrypted field that will be possible to search it.

Kumud Thakur: No, no, it won't be searchable. But we I was saying like we will create a one more custom field where we keep only last four digit of social security and that custom field will be a searchable

Javier Flores: Okay.

Kumud Thakur: cuz the the agent want to search with the last four digit of security or social security number.

Javier Flores: Okay. And what you choose an encrypted field and not for example control the visibility using uh permission set field level security.

Kumud Thakur: I would choose encrypted field because there is something. Yeah, good good point. Instead of in we can use field level security as well. Uh but I still I would like to go with the encrypted field to make it more secure and with field level security as well.

Javier Flores: Okay. Um, but for example, you have a mirror field to store and make it searchable.

00:42:24

Kumud Thakur: Mhm.

Javier Flores: It's not like how you are make sureing that you are protecting in the same way that second field because you will follow in the same thing right you will a

Kumud Thakur: Mhm. Mhm.

Javier Flores: field that you need to control using field level

Kumud Thakur: Yeah. So the same rule like same FLS we have to we need to apply on the uh other field as well. But then problem is then how the agent will search because the agent want to search using the fourdigit number. It means agent did an access on that custom field. So my assumption is that custom fields with four digits should be visible to the agents like the agents and the sales staff and the manager or the executive while uh the the phone number should be visible to only the manager. So that's why I was thinking maybe we use uh encrypted field and with field field level security just to encrypted field just to give an additional security and field level security makes sure like this field is not visible to any other users.

00:43:29

Javier Flores: Okay, thank you.

Avijit Chakraborty: Uh Kumud I have one question and that is my last question is uh how you are

Kumud Thakur: Mhm.

Avijit Chakraborty: surfacing product recommendation while creating questionnaires.

Kumud Thakur: So uh so uh for the product recommendation uh we have an metadata where we configure the rules and uh in the metadata basically we do have some sort of mapping between a QA response and the product and according to the QA response we just uh uh read the metadata and get the recommended product and we will use a screen flow on the lead object. on the lead record page.

Avijit Chakraborty: Okay. I'm good. So if nobody has no more question then we can go to the feedback.

Kumud Thakur: Thank you.

Javier Flores: I maybe have one last question.

Avijit Chakraborty: Yeah.

Kumud Thakur: Mhm.

Javier Flores: Uh you maybe I misunderstood or I hear wrong that you mentioned you

Kumud Thakur: Mhm.

Javier Flores: are using scheduler right?

Avijit Chakraborty: Okay.

Kumud Thakur: Yeah. Scheduler for the appointment.

Javier Flores: Uh c can you walk me through that process?

00:44:53

Javier Flores: Who is creating the appointment?

Kumud Thakur: Uh so sales sales is staff who is working on that lead application. So they just go to the customer profile and then uh they they would like to schedule an appointment and they would like to see the nearest branch. So we have a Salesforce protocol scheduler. So we will use that scheduler with their scheduler component on the on the on the customer account where we will uh pull that component on the screen and uh my assumption is that component will basically pull that uh the customer uh address and it will display the nearest uh branch and the customer need to choose the the staff or the customer will choose uh over the phone or the when they meet one to one they select that the branch and then Uh so basically then the scheduler will help us to like find out like who is available in that particular branch. So they can just uh schedule an appointment for for them for the customer.

Javier Flores: So you are so the internal users are creating the appointment using scheduler with the customer right and I

00:46:05

Kumud Thakur: Right. Yes.

Javier Flores: as I know scheduler needs a way to know the availability for in this case for the customers. How can you get what's the availability for all the customers to make this work?

Kumud Thakur: So, uh my assumption is like uh uh uh the customer is over the phone. Okay. And the sales staff was booking an appointment on the customer behalf. And then uh the staff will uh give an options like multiple options to the customer like these are the available options. And if it is say or yes or no on on depend depend right. So according to that the staff will book an appointment for customer.

Javier Flores: Okay. And for example, if you have it, if you have the customer on the phone,

Kumud Thakur: Mhm.

Javier Flores: it will be easier to just create an event

Kumud Thakur: event. Uh thinking uh the challenge with the event if we use event like we do have like uh uh like 2,000 branches, right? So let's say the customer choose

anyone the branch then how do we know like which particular sales staff staff is available.

00:47:33

Kumud Thakur: So if we have that setular so we knows like who is available from that particular branch otherwise it's very hard like we we never know like who is who is available or not.

Javier Flores: Okay. Yeah, that makes sense. Yeah, that that was my last question. Thank you,

Kumud Thakur: Thank you. Okay.

Javier Flores: Yes. So I think we are going through the feedback. So I think it was a very good presentation Kamut. Thank you very much.

Kumud Thakur: Okay.

Javier Flores: Uh you I think you sometimes I noticed that you were more focused on

Kumud Thakur: Mhm.

Javier Flores: your document on the right side with the requirement document and you sometimes you kind of forgot to maybe point something on the on the left side uh on the data model when you were

Kumud Thakur: Mhm. Mhm.

Javier Flores: mentioning different objects you just uh like focus on the right side. So it will be used to take advantage of the boat of of the splitted view. So you you just don't forget to maybe just point uh the object, what's the relationship, those kind of things.

00:48:59

Javier Flores: Um the artifacts are are good. Maybe I'm kind of blind, so I had to zoom a little bit on the data model. Uh but I have a bad uh eyes,

Kumud Thakur: Mhm.

Javier Flores: so that's probably that's on me. But just make sure that everything it's visible. Maybe just make it uh zoom to content.

Kumud Thakur: Yeah.

Javier Flores: just the presentation. Um, and yeah, I think you defended good um the questions uh during the Q&A. You pivot on something that you were able to think on the flight and change some things and defend the questions. So, I think you did a good job there. Uh maybe just like double check some things just to sounds more confident. For example, on the knowledge multilanguage in your right need to create different kind

Kumud Thakur: Mhm.

Javier Flores: of different articles but just you use words that makes me think you are unsure. So I I give a lot of feedback related to I I just to avoid using like

Kumud Thakur: Mhm.

00:50:10

Javier Flores: I think I guess or those uh sounds more confident. Um and yeah I think that's pretty much from my side. Thank you very much Kum. Very very good job.

Kumud Thakur: Thank you. Thanks for your feedback.

Avijit Chakraborty: Hey Kumud, I'll start. Uh I think you did a good job while in the timings. Um I have seen like gaps in couple of gaps were the first one

Kumud Thakur: Mhm.

Avijit Chakraborty: like when I asked for the report. Um it was LDV and I'm asking you again. So when you are say like doing a report on LDP you should mention indexing and skinny

Kumud Thakur: Oh,

Avijit Chakraborty: table otherwise like it is it is not good and then by looking at the

Kumud Thakur: okay. M

Avijit Chakraborty: volume I don't think salesforce report will be capable of rendering anything so your

Kumud Thakur: yeah I lateralize it.

Avijit Chakraborty: QA uh thing is yeah it is it is not going to work so that's why I'm

Kumud Thakur: Yeah.

Avijit Chakraborty: pushing on that so that is one thing I have seen like even if you are doing a reporting you should mention screen table and indexing so that it's it's faster so and then and the second

00:51:16

Kumud Thakur: Yep. Yep.

Avijit Chakraborty: thing was um on how you are doing the product recommendation I think you built a custom solution whenas we have Einstein recommendation on next week section

Kumud Thakur: Okay. Okay.

Avijit Chakraborty: which can be used for there like which will be trended and automatically select like

Kumud Thakur: Mhm.

Avijit Chakraborty: what best product for the customers we have by looking at the customer demography age and

Kumud Thakur: Mhm.

Avijit Chakraborty: whatever it can do like you can build a custom recommendation engine in using your own recommendation

Kumud Thakur: Okay.

Avijit Chakraborty: engine recommendation and and then that's I

Kumud Thakur: Mhm.

Avijit Chakraborty: think that is also fine and then on uh surfacing the map nearest I think that also not not very clear solution how they're going to schedule and how they see people like see see different bank on a map means

Kumud Thakur: Mhm.

Avijit Chakraborty: the requirement was they need a UI where they will see uh all the banks nearby on a map and then click on a map and then schedule something that's my understanding of the requirement uh but it was not very clear how they are going to do it means Um

00:52:26

Kumud Thakur: Yeah. I think I think we have to use a map Salesforce map probably but I'm not sure that's why I just put scheduleuler for the appointment and my assumption was maybe sh Salesforce schedule have the capability to find the nearest uh branch or whatever.

Avijit Chakraborty: yes,

Kumud Thakur: So like

Avijit Chakraborty: but the requirement was they want to see something in a particular way which only map can do. Salesforce scheduleuler like you will go there, you put your zip code and then show the available uh requirement. So it's a it's a similar but it don't don't show on a map. So you can definitely deviate from your requirement and say like rather than map I will use also scheduleuler which is

Kumud Thakur: Okay.

Avijit Chakraborty: like more robust but the requirement was like you show they give their jeep code and you do a distance query and bring all the information using an LWC they will click on it and then schedule appointment it will create an event I think that that should be a straightforward but like if you use map that will be like more

00:53:12

Kumud Thakur: Okay.

Avijit Chakraborty: because we don't have uh anything and then your external role hierarchy can you go back to a role hierarchy uh like why you are doing it. It is very unclear like who report to whom. Um it is like though you told but it is very hard for my mind to understand like do it

Kumud Thakur: Mhm.

Avijit Chakraborty: like I think you should create another column like person reports too and then it like it will be automatically create a uh like a p table view like an hierarchy

Kumud Thakur: Mhm. Okay.

Avijit Chakraborty: thing automatically and then you missed like how you are going this role will be replicated per region I think I have not heard that part but I assumed that will be but I did not ask any question because That's a very straightforward question.

Kumud Thakur: M. Mhm.

Avijit Chakraborty: So those are the things and then um on the data migration u data migration part uh it's okay but you missed couple of

Kumud Thakur: Mhm.

Avijit Chakraborty: uh part like when you're building spread sheets and a general opportunity like using an

00:54:15

Kumud Thakur: Mhm.

Avijit Chakraborty: external ID uh to uh like tie things up and then that was like and

Kumud Thakur: Oh yeah.

Avijit Chakraborty: then primary key chunking you are doing a bulk data load so like definitely automatically primary key chunking will be But like you should group the records together so that roll up does not happen. And the second question is like when Javiercounter you with the question I think your

Kumud Thakur: Mhm.

Avijit Chakraborty: answer should be it will be a lookup field and I'll make sure I'll uncheck the box like it should not uh do anything like when the record is blank. So you'll allow the record to be blank so that there will be no skew.

Kumud Thakur: Mhm.

Avijit Chakraborty: So if you use a lookup field instead of master detail and then say like okay you can bank out this field it's totally out of the skew you can have 1 million record it's not going to impact

Kumud Thakur: Okay.

Avijit Chakraborty: so these are my feedback otherwise it's it's good uh just try to use like

Kumud Thakur: Okay. Good work.

00:55:09

Avijit Chakraborty: um more uh Salesforce provider solution so my solution I also included a data cloud to bring the external object and for the identity resolution um otherwise is I think everything is similar. So I have not used external object. I use DLO. So otherwise it's it's more or less similar.

Kumud Thakur: Okay.

Avijit Chakraborty: I don't have any problem. It's good.

Kumud Thakur: But if you you are using DLO then how are you offloading a Salesforce data?

Avijit Chakraborty: It is not resides inside the CRM,

Kumud Thakur: Okay.

Avijit Chakraborty: right? It is residing in the data cloud in the DLO.

Kumud Thakur: Other Okay.

Avijit Chakraborty: DLO can be like a zero copy thing from your snowflake or whatever it is.

Kumud Thakur: Okay. Mhm.

Avijit Chakraborty: So rather than using the file connector and all those things I think that is an old technology still good like if you are using lightning data connector and all those. So uh like you can use a data cloud and connect data cloud using a DLO and then you can have a multiple data space and all those things will automatically come in picture.

00:56:07

Avijit Chakraborty: So with an external objects similar things like it is it is very similar but it is little bit an old technology. So I I'm preferring now for my perspective I'm preferring using a data cloud and using data cloud as a connector to other systems and using a DLO and data space so that like you can do segregate on all those things and then

Kumud Thakur: Mhm.

Avijit Chakraborty: you can do all those uh run flows run platform events and all those things you can easily can be done and then the data cloud records is automatically like uh DLOS are also because you have access to the data space you see only those records and then it's it's easier to give you access mean otherwise in your uh external object you have to write restriction

Kumud Thakur: Mhm.

Avijit Chakraborty: rules and another thing like you use Salesforce standard files I think it will be like you have to buy additional space to have that Many. documents to be uploaded. So think about like up to 3 million things are coming and then 20%

Kumud Thakur: Mhm.

00:57:03

Kumud Thakur: Yeah.

Avijit Chakraborty: of it is opportunity and then during 3 million if you have like at least five documents or three documents. So every 9 million documents you're uploading and you don't have that much space because we get space based on your internal user not by external users.

Kumud Thakur: Mhm.

Avijit Chakraborty: So that file space is also a concern like you should use any box

Kumud Thakur: Mhm.

Avijit Chakraborty: or anything else like that.

Kumud Thakur: Yeah, right.

Avijit Chakraborty: So that is also I'll see a

Kumud Thakur: Yeah, I missed that point. I was I was thinking like maybe we just pull that files from from the Salesforce and put it in the like Amazon S3 bucket and we'll do the file connect to for the data flow.

Avijit Chakraborty: you have to do something because the file storage will blow up within a week.

Kumud Thakur: Yeah.

Avijit Chakraborty: So uh that's not a or you have to buy fly file storage.

Kumud Thakur: Yeah. Mhm. Yeah.

Avijit Chakraborty: So that's all otherwise uh it's it's it's good and then I in in your landscape I don't see like the government APIs.

00:57:59

Avijit Chakraborty: So it's also calling government APIs like your enterprise service bus is missing the government

Kumud Thakur: Yeah. Yeah.

Avijit Chakraborty: APIs. So and then uh also in core banking you used fire and forget but I think it's a request and reply when a person is creating an account uh at that point of time when the customer is present in front of it and they want an customer account number it has to be request and reply. If it is a fire and forget you don't know when it goes and when it come backs. So when your staff member is creating an account and they want a customer like when they search it's not

Kumud Thakur: Mhm.

Avijit Chakraborty: present and then they create an account. So that has to be a request and reply. This that cannot be a fire and forget pattern.

Rónán Dillon: I thought though just when you're talking about those government agencies, is that not the the core banking system is integrated with those and the core banking system will cancel the application and update the

00:58:55

Kumud Thakur: Let

Rónán Dillon: account. So Salesforce doesn't actually have to be connected with those. So I think he's right with that.

Avijit Chakraborty: Oh,

Kumud Thakur: me see.

Avijit Chakraborty: what was that like? No, that is a like you call the government API and then core banking system close that account you will make a remote call in and update is fine. I'm talking about a a staff comes do a global search did not find the account and try to create the account.

Rónán Dillon: But where's the government there?

Avijit Chakraborty: So this is this is fine. No, this is fine. Now this is there are two questions government agencies I'm fine but I'm saying like government agencies is missing is in landscape means how the government agencies are being called so there is no connection from enterprise service to government agencies APIs

Rónán Dillon: But I don't think there should be.

Avijit Chakraborty: Why?

Rónán Dillon: Sorry accident myself. So the bank account application may be subject to view in which case the core banking system will cancel the application.

00:59:49

Rónán Dillon: So in my eyes it's the go the Yeah.

Avijit Chakraborty: Yes. So review by government agencies how how it will being reviewed and how it will come

Rónán Dillon: This the government. So the government so it it gets it gets created in the core banking system the core bank then it

Avijit Chakraborty: Yeah.

Rónán Dillon: gets reviewed.

Avijit Chakraborty: Then then you are saying like you then you are exposing exposing your core banking system to government

Rónán Dillon: So the the integration would be from

Avijit Chakraborty: agencies mean there should be some integration that government agencies will send the information back to your core banking right.

Rónán Dillon: yeah but that I would say that already exists wouldn't it?

Avijit Chakraborty: So,

Rónán Dillon: So it already exists with

Avijit Chakraborty: so but it is not present in the landscape. That's what I mentioned like it is not a very big mistake but

Rónán Dillon: but like what I would what I would suggest like it's not in mine either.

Avijit Chakraborty: this

Rónán Dillon: So I would suggest that it's not a mistake because it's not so like what I what I what I see that for that requirement I see that as more as a remote call in. So the government agency updates the core banking or the core banking system up gets updated

01:00:37

Avijit Chakraborty: how how how but you are

Rónán Dillon: between an integration between those two systems not nothing to do with us or the ESB

Avijit Chakraborty: not presenting in your landscape means your landscape is totally missing that

Rónán Dillon: but it doesn't need to be because it's not integrating with Salesforce. That's something that they do separately because there's no there's no mention of the government agencies being

Avijit Chakraborty: uh yes yeah that is fine like

Rónán Dillon: integrated with us.

Avijit Chakraborty: you can defend it that way and then I'm talking about the second part where um you like the person searches the account.

Kumud Thakur: So here uh I have a sorry Avijit I have a confusion now. So the bank account application may be subjected to review by government agency right?

Avijit Chakraborty: Mhm.

Kumud Thakur: So the government so we are saying government agency is integrated with the core banking system. So first my data will go to the core banking system then it will go to the agency for review and then government a system will update the s the application status in

Avijit Chakraborty: Mhm.

01:01:27

Avijit Chakraborty: No,

Kumud Thakur: the core bank Ster.

Avijit Chakraborty: no. So think about like what happened. So we you and me both are Indian, right? So we we are foreigner. So when you go open an account, you say like are you a US citizen? We say no. And then we have to give our foreign tax number. So what happened? every year like the if thing happens right. So once in a year bank reconcile how many foreigner they have and they send the file to the government agencies like IRS and then IRS say like okay this person has some problems and he has this this these things red flag close his account freeze his account send that information yearly so this

Kumud Thakur: Mhm.

Avijit Chakraborty: yearly comes and then they say okay this account need to be frozen they close that account and it goes back to Salesforce so this is a separate process so my question is like I presented it and then like say I presented with an enterprise a service bus means how there is an API with the government agencies and I'm not because generally code banking system resides behind the firewall and nobody talks with it directly.

01:02:25

Kumud Thakur: Mhm.

Avijit Chakraborty: So that's my goal is but like if you have like a separate integration file based you don't want to show it here it's also fine. So as long as you defend it so there is no no problem with that.

Kumud Thakur: Mhm.

Avijit Chakraborty: Um so the another thing what I was talking

Kumud Thakur: But is still still still let's say I'm a new I'm a new customer. I fill the application,

Avijit Chakraborty: Mhm.

Kumud Thakur: right?

Avijit Chakraborty: Mhm.

Kumud Thakur: So my question is the the verification the review will it before the application submit to the main system the core system or it is after the application submit to the core system that I'm trying to stand.

Rónán Dillon: better be after cuz the time.

Avijit Chakraborty: So, Maybe.

Rónán Dillon: says the core the core banking system will cancel the application.

Avijit Chakraborty: So it says maybe. Yeah. Yeah.

Rónán Dillon: So I'd make the assumption there that it's already created in the CV core banking system.

Kumud Thakur: Okay.

Avijit Chakraborty: Yeah. So yeah,

Kumud Thakur: Okay.

01:03:05

Avijit Chakraborty: it it has to be created first to be cancelled.

Rónán Dillon: So yeah,

Avijit Chakraborty: So if it is does not exist then how you cancel it.

Kumud Thakur: Yeah.

Rónán Dillon: so like how I read it is there's the first requirement

Kumud Thakur: Okay.

Rónán Dillon: um oh wait no sorry I'm mixing that up. Sorry it's after it. Um but yeah so like I read that requirement as they want to show a remote call-in integration. So as in an integration that kicks off from the core banking system and goes back to Salesforce.

Kumud Thakur: Mhm.

Rónán Dillon: So the change happens in the core banking system. What happens? The ESV takes up that that change, sends it into Salesforce and updates the record from

Avijit Chakraborty: Yeah.

Rónán Dillon: there.

Avijit Chakraborty: Yes. No integration pattern is fine here.

Kumud Thakur: Okay.

Avijit Chakraborty: So another thing like I think you can do the search one that four digit when the account creation I think you

Kumud Thakur: Mhm.

Avijit Chakraborty: write fire and forget.

Kumud Thakur: Mhm.

Avijit Chakraborty: Uh that has to be request and reply.

01:04:01

Avijit Chakraborty: If you can find it it is

Kumud Thakur: Which one? This one is request and reply.

Avijit Chakraborty: Yeah.

Kumud Thakur: Get the background then.

Avijit Chakraborty: So it is the customer servicing servicing process. Uh second bullet point

Kumud Thakur: Okay. Okay. This one. This one.

Avijit Chakraborty: uh yeah if the customer does not exist.

Kumud Thakur: Okay.

Avijit Chakraborty: I think here you did FF. see that it has to be request and reply because they want an immediate customer ID. That's my understanding is

Kumud Thakur: Yeah. I will return a Yeah, right. We'll return a custom ID. Yeah. Okay.

Avijit Chakraborty: otherwise it is fine like you are like timing it is it took like it is not at all 30 minutes and 90 minute thing but yeah you did great couple of little bit mistake and then uh I think you said scheduler and it was like little bit um naming is not All right.

Kumud Thakur: H I think I need to go through the scheduler because I'm not familiar much with the scheduler

01:05:08

Avijit Chakraborty: Thank

Kumud Thakur: and Salesforce map.

Rónán Dillon: Can I actually can I actually go back to the um to that one?

Kumud Thakur: So I think these are the two app have to go through it.

Rónán Dillon: I actually So I'm just looking at mine from a while ago. I also went fire and forget for that one. So what my assumption was is like how the process would be is user needs to create an account because it doesn't exist. So they create the account um information gets sent to the core banking system and the core banking system can whenever it's done send the data back send the customer number back in a firefront like as a remote colon. So it doesn't need to be request and reply.

Kumud Thakur: Mhm.

Rónán Dillon: So I think he's I don't I wouldn't necessarily think he's wrong there if he can if he argues that

Avijit Chakraborty: Yeah, that argument should be there like because I assume The account number is not visible but like my assumption was this account number is like the customer account number uh which is coming as a like an external ID

01:06:08

Rónán Dillon: Yeah.

Avijit Chakraborty: so when you're creating it you need to have that so then there is always a geoparty management like this mainframe system always fails so there will be like multiple questions over there but that that was my assumption and I asked

Rónán Dillon: Okay.

Avijit Chakraborty: it should not be a request and reply and then if you're able to defend it like this was my assumption it will be created in sales post so that like nothing is hold up and then I'll do a fire and forget call when things up and it will be coming if they want to see it I'll change it to request and reply so this is just just a feedback on question and

Rónán Dillon: Yeah.

Avijit Chakraborty: answer so it's nothing wrong here like we had this all these things like you can do it in a five different ways

Rónán Dillon: Yeah.

Avijit Chakraborty: as long as you can have an proper assumption and explanation I think that's good okay thank you

Kumud Thakur: Yeah.

Rónán Dillon: Yeah.

Kumud Thakur: Okay. All right. Thank you.

Avijit Chakraborty: Kumud Wait,

Kumud Thakur: I have to drop. Thanks.

Rónán Dillon: Yeah,

Kumud Thakur: Thank you.

Rónán Dillon: thanks. Yeah,

Kumud Thakur: Thank you.

Avijit Chakraborty: wait,

Rónán Dillon: nice pres presentation.

Avijit Chakraborty: wait.
